# V-Band Couplings

## Standard Tube Size and Variable Diameter V-Band Couplings

Eaton's Marman V-Band couplings and flanges connect and seal all types of tubing, piping, ducts and containers. Assembly or disassembly of the compact coupling is a simple operation requiring only a few seconds. A selection of

three standard latch styles offers the best choice for any application.

V-Band couplings eliminate use of heavy bolted flanges, yet offer high strength and light weight. Standard flanges are available for pressure and structural applications at temperatures to 800°F (427°C).

Six V-Retainer cross sections are available in standard tube O.D. sizes to meet any operating conditions. The material gauge and configuration of the retainer determines the operating performance of the coupling.

Use performance rating charts shown on page 5 for the selection of the appropriate V-Band couplings and flanges in

standard tube O.D. sizes to provide minimum weight with maximum strength for specific application requirements.

Eight additional cross-sections shown on pages 12 and 13 can be ordered in any increment from the minimum diameter shown with each part number to twenty inches. Performance ratings are listed on page 15.

### T-Bolt Latch Coupling

For use for higher strength semi-permanent applications or where frequent assembly and disassembly is not required.

### Quick-Coupler Latch Coupling

For applications requiring frequent assembly or disassembly, Quick-Coupler Latch can be connected or disconnected without removal of nut.

### Multiple Latch, Quick-Coupler and T-Bolt

For larger size (6" and over) applications, equal distribution of band tension is provided with the two latches.

## Gasket

The flat gasket used with Flange P/Ns 4550 and 4560 may be rubber, metal, or a combination of these materials. The gasket must be designed to compress to a .060 minimum thickness for proper coupling assembly.

The O-Ring gasket used with Flange P/Ns 4560 and 4570 may be of any rubber or silicone compound depending on the application. Standard gaskets of the series AN123851 through AN124050 may be used for all sizes. For tube sizes over

5 inches, standard O-Rings of the next smaller size than the flange cavity diameter may be purchased and stretched into position during assembly. These O-Rings can be obtained from local sources. The cavity area of the flanges has been designed to permit this application.

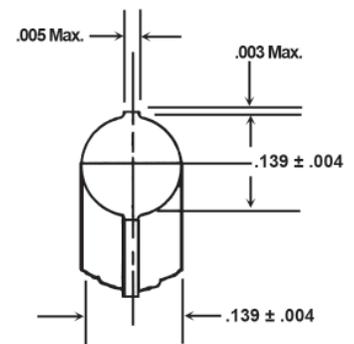

Flanges are available for V-Band coupling P/Ns 4563, 4573, 4583, 4564, 4574, 4584, 4565, 4575 and 4585.

The same female flange is used for both O-Ring sealed

flanges and gasketed flat-faced flanges.

Flange P/Ns 4550 and 4560 are used to make a joint using a flat gasket of rubber or metal.

Flange Part Numbers 4560 and 4570 are used for O-Ring applications. The O-Rings used are the series AN123851 and AN124050. This same set of flanges 4560 and 4570 may be used for structural applications by omitting the O-Ring.

O-Ring Gasket

### Approximate Weights

To determine the weight of a coupling, select the  $K_1$  and  $K_2$  values from the table below and insert them in the following formula:

$$W = K_1 + (K_2D)$$

D = Nominal Diameter of coupling, inches.

**Example:** Coupling No. NE102788-0948AM

$$K_1 = .233$$

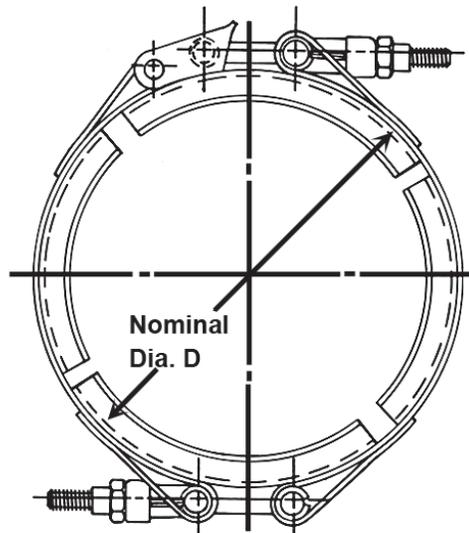

$$K_2 = .086$$

$$D = 9.48$$

$$W = K_1 + (K_2D)$$

$$= .233 + (.086 \times 9.48)$$

$$= 1.048 \text{ lbs.}$$

Part Number	$K_1$	$K_2$	Part Number	$K_1$	$K_2$
NE102142	.112	.035	NE102665	.065	.035

# Selection of correct V-Band Couplings and Flanges

To select V-Band couplings and flanges, the following factors must be known. These include loading, temperature, desired safety factor and tube O.D. Loading may consist of internal pressure, bending moment and/or axial tension. Ratings are based on the maximum load, which will not produce structural yield of any component part.

Please follow these steps to select the correct V-Band couplings and flanges.

**Step 1. Pressure Load.** If an internal pressure load exists, use Chart 1. Locate a point representing the proof pressure (twice operating pressure) on the left-hand scale. Draw a horizontal line from this point to the diagonal line representing the tube O.D. From the intersection of these two lines, draw a vertical line to the bottom scale to determine  $N_p$ .

**Step 2. Bending Moment** If a bending moment load exists, use Chart 2. Locate a point representing the bending moment (in inch-pounds) on the left-hand scale. Draw a horizontal line from this point to the diagonal line representing the tube O.D. From the intersection of these two lines draw a vertical line to the bottom scale to determine  $N_B$ .

**Step 3. Axial Tension.** If an axial tension load exists (other than pressure), this can be calculated by dividing the axial load in pounds by the circumference at the flange O.D. in inches to determine  $N_A$ .

**Step 4.** The total load intensity (N) is found by adding  $N_p$ ,  $N_B$  and  $N_A$  as determined in Steps 1, 2 and 3.

**Step 5. Temperature Strength Conversion.** If the environmental operating temperature is above 100°F (38°C), a correction for temperature is necessary. Multiply the load intensity (N) obtained from Step 4 by the temperature correction factor. Please note that there are temperature correction factors shown below for both aluminum and stainless steel. Aluminum flanges should not be used above 500°F (260°C).

**Step 6. Safety Factor.** To calculate a specific safety factor, multiply N (with temperature correction, if applicable) by this safety factor.

**Step 7.** Using the rating Chart 3, draw a horizontal line from the tube O.D. on the left-hand scale to intersect a vertical line from N (as corrected in Steps 5 and 6, if applicable) on the bottom scale. All curves to the right of this intersection point represent components which may be used. See coupling part numbers and flange material codes under Chart 3. If no curves are to the right of the intersection, consult your Eaton representative for special flange materials or configuration.

**Step 8.** See flange specifications and dimensions on pages 13 and 14 and coupling specifications and dimensions on pages 6–11.

To select a V-Band coupling for special flanges using Chart 4, follow the same procedure utilizing Charts 1 and 2 to determine N, applying correction and safety factors.

After determining the proper coupling to meet exact operating conditions, select the choice of latch style from the three offered as shown on each of the following Dimension and Specification pages. A separate part number is designated for each latch style for each of the V-Retainer cross sections shown.

**Example:** A V-Band coupling with flanges is required for the following conditions:

Tubing	3.00 in. dia. Stainless steel
Proof Pressure	300 psi
Bending Moment	2000 pound-inches
Axial Load	1000 pounds
Temperature	600°F (315°C)
Safety Factor	1.1

**Step 1. Pressure Load.** (Follow dotted line on charts) Draw a horizontal line from 300 on the proof pressure scale to the diagonal line labeled 3.00 (tube O.D.). The intersection point is directly above 240 on the  $N_p$  scale at the bottom.

**Step 2. Bending Moment.** Draw a horizontal line from 2000 on the bending moment scale to the diagonal line labeled 3.00 (tube O.D.). Directly below the intersection point, we find  $N_B$  equal to 190.

**Step 3. Axial Tension.** Flange O.D. for 3.00 – 3.78 (see page 14). Dividing 1000 by  $\pi \times 3.78$  results in  $N_A=80$ .

**Step 4.** N equals 240 + 190 + 80 = 510

**Step 5. Temperature Strength Conversion.** Multiply 510 x 1.30 (temperature correction for stainless steel at 600°F) = 663.

**Step 6. Safety Factor.** Draw a horizontal line from 3.00 on the tube O.D. scale (Chart 3) and a vertical line from 730 on the bottom scale (N) and determine the intersection point. If, the solid red line curve (stainless steel flanges) and the white line curve (V-Band couplings part numbers 4565, 4575 and 4585) fall to the right of this point indicating these components are suitable.

**Step 7.** See flange specifications and dimensions on page 14 and coupling specifications and dimensions on pages 6–11.

## Explanation of Symbols

Symbol	Meaning	Units	Formula
$N_p$	Load Intensity Due to Pressure	inch-pounds	$N_p = \frac{P(D_S)^2}{4D_F}$
$N_B$	Load Intensity Due to Bending Moment	inch-pounds	
$N_A$	Load Intensity Due to Axial Tension	inch-pounds	$N_B = \frac{4M}{\pi(D_F)^2}$
N	Total Load Intensity	inch-pounds	
$D_S$	Sealing Diameter	inches	$N_A = \frac{A}{\pi D_F}$
$D_F$	Flange Outside Diameter	inches	
P	Pressure	psi	$N = N_p + N_B + N_A$
M	Bending Moment	inch-pounds	
A	Axial Tension	pounds

All dimensions in Inches  
NOTE: To facilitate assembly of smaller diameter couplings, the T-Bolt is curved and the retainer gap is rotated under the latch.

## How to Order

### Order by Part Number

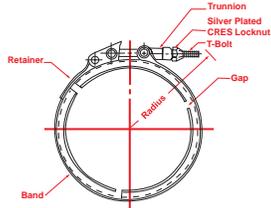

Separate part numbers are designated for each latch style. T-Bolt and nut are furnished with coupling.

### 4564-250

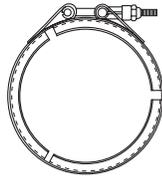

- Size 2.50 inch
- Quick Coupler Latch Coupling

# Standard tube size V-Band Couplings

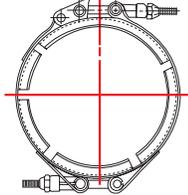

Part numbers 4565, 4575, 4585

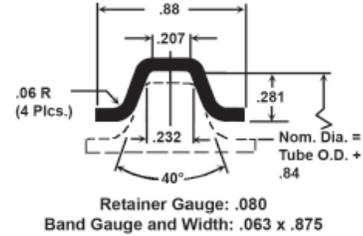

Quick Coupler Latch Couplings  
1 Latch - 3 Segments

T-Bolt Coupling  
1 Latch - 3 Segments

Multiple Latch Coupling  
2 Latches - 4 Segments

Tube Size O.D.	Part Number	Weight Lbs.	Part Number	Weight Lbs.	Part Number	Weight Lbs.		
2.50	4565-250	.71	4575-250	.61	Not Available Under 6.00			
2.75	4565-275	.73	4575-275	.63				
3.00	4565-300	.76	4575-300	.66				
3.50	4565-350	.82	4575-350	.72				
4.00	4565-400	.88	4575-400	.78				
4.50	4565-450	.97	4575-450	.87				
5.00	4565-500	1.04	4575-500	.94				
5.50	4565-550	1.10	4575-550	1.00				
6.00	4565-600	1.16	4575-600	1.06			4585-600	1.37
